

When you call the `turnOn()` method the power source is turned on, and these wires are powered with a higher amperage:

Wire color	Voltage
Orange	+3.3V DC
Red	+5V DC
Yellow	+12V DC
Blue	-12V DC

The gray wire should be connected to the Arduino. In case power supply stops working as expected, for example due to an overload protection, the library will automatically reset the power supply.
